PANEL POINT 24

FROM AECOM SHEET

HANGER DL = 1540 kN } $\Sigma = 1920$ kN
LL = 380 kN

SLOPE = ANGLE $\theta = 16.1402^\circ$

FOS ASSUMING 6 BOLTS HAVE 800 kN TENSION
EACH & $\mu = 0.3$ HAS BEEN CALCULATED
BY AECOM AS 2.70.

$\mu = 0.3$ (ASSUMED)

W = LOAD DUE TO HANGERS

W_{DL ONLY} = 1540 kN

W_{TOTAL} = 1920 kN

$$\sin \theta = \sin 16.1402^\circ \\ = 0.27799$$

$$F = W \sin \theta$$

$$F_{\text{TOTAL LOADS}} = 1920 \times 0.27799 = 533.74 \text{ kN}$$

$$F_{\text{DL ONLY}} = 1540 \times 0.27799 = 422.5 \text{ kN}$$

TWO BOLTS HAVE CRACKED NUTS

TENSION IN REMAINING BOLTS DECREASES DUE
TO RELAXATION (RELAXATION UNKNOWN).

AS PREVIOUS

CALCULATE % OF RELAXATION IN 5 BOLTS TO
CAUSE FOS ≤ 1.0

$$FOS = \mu R / F \quad (R = \text{LOAD IN BOLT})$$

$$FOS = 1.0 = 0.3 \times \frac{R}{F}$$

TOTAL
LOAD CASE

$$R_T = \frac{F_T}{0.3} = \frac{533.74}{0.3} = 1779.13 \text{ kN}$$

WHICH IS 355.8 kN PER BOLT

$$\% \Rightarrow \left[1 - \frac{355.8}{800} \right] \times 100 = 55\% \text{ REDUCTION}$$

Output

PANUEL POINT 24 (CONT'D)

FOR DEAD LOAD CASE

$$R_{DL} = \left(\frac{422.5}{0.3} \right) / 5 = 281 \text{ kN Per Bolt}$$

$$\text{PERCENTAGE REDUCTION} = \frac{800 - 281}{800} \times 100 = \underline{\underline{64\%}}$$

(5 Bolts Contributing)

ASSUME 4 BOLTS REMAINING (TOTAL LOAD)

$$R_T = \frac{1779.13}{4} = 444.8 \text{ kN (Per Bolt)}$$

$$\text{PERCENTAGE REDUCTION} = \frac{800 - 444.8}{800} \times 100 = \underline{\underline{44.4\%}}$$

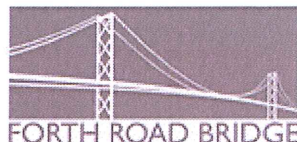

ASSUME 4 BOLTS REMAINING (DEAD LOAD)

$$R_{DL} = \left(\frac{422.5}{0.3} \right) / 4 = 352.1 \text{ kN (Per Bolt)}$$

$$\text{PERCENTAGE REDUCTION} = \frac{800 - 352.1}{800} \times 100 = \underline{\underline{56\%}}$$

	<p><u>Determine the Slip Factor/Coefficient of Friction</u></p> <p>Unfortunately no tests were carried out during construction to determine the friction between cable band bolts and main cables.</p> <p>From the FRB ICE proceedings friction between the wires of the main cable and metal sprayed surfaces of the saddles was assumed to be equal to 15%. The Proceedings state that practical test made by the Contractor gave results of 30% however no details of these are provided.</p> <p>Testing has been carried out for other suspension bridges for example for the Delaware River Bridge full size test was carried out by Lehigh University. The conclusion of these test were that bulging of the main cable contributed significantly to resisting slip.</p> <p>BS 5400 part 3 clause 14.5.4.4 gives slip factors at friction surfaces for HSFG bolts:</p> <table> <tr> <td>For weathered surfaces clear of rust and mill scale</td> <td>$\mu =$</td> <td>0.45</td> </tr> <tr> <td>For surfaces with sprayed zinc</td> <td>$\mu =$</td> <td>0.4</td> </tr> <tr> <td>For surfaces blasted with shot or grit</td> <td>$\mu =$</td> <td>0.5</td> </tr> <tr> <td>For surfaces with sprayed aluminium</td> <td>$\mu =$</td> <td>0.4</td> </tr> <tr> <td>For surfaces treated with zinc silicate paint</td> <td>$\mu =$</td> <td>0.35</td> </tr> <tr> <td>For surfaces treated with etch Primer</td> <td>$\mu =$</td> <td>0.25</td> </tr> </table> <p>Neither BS 5400 or the Eurocodes provide a slip factor for galvanised surfaces. Various tests have been carried out for galvanised surface and results range significantly. The Galvanisers Association specifies the following slip factors are achieved depending on the preparation of the surface:</p> <table> <tr> <td colspan="3">Preparation Technique</td> </tr> <tr> <td>As galvanised</td> <td>$\mu =$</td> <td>0.14</td> </tr> <tr> <td>Weathered galvanised</td> <td>$\mu =$</td> <td>0.20</td> </tr> <tr> <td>Galvanised-wire brush</td> <td>$\mu =$</td> <td>0.31</td> </tr> <tr> <td>Galvanised-grit blasted</td> <td>$\mu =$</td> <td>0.31</td> </tr> <tr> <td>Bare steel, as-rolled</td> <td>$\mu =$</td> <td>0.35</td> </tr> </table> <p>Some time after the connection is made the Galvanisers Association states that galvanised joints will develop a characteristic known as 'lock-up' The 'lock-up' is a result of friction between the two galvanized surfaces during dynamic movements. After 'lock up' a friction coefficient equal to that of bare steel can be achieved as above (35%).</p> <p>Cable Band Bolts Surfaces</p> <p>The surface of the cable band is assumed to be bare steel. The surface the main cable wire is galvanised steel.</p> <p>The minimum sip value should therefore be used - 0.20 for weathered steel.</p>				For weathered surfaces clear of rust and mill scale	$\mu =$	0.45	For surfaces with sprayed zinc	$\mu =$	0.4	For surfaces blasted with shot or grit	$\mu =$	0.5	For surfaces with sprayed aluminium	$\mu =$	0.4	For surfaces treated with zinc silicate paint	$\mu =$	0.35	For surfaces treated with etch Primer	$\mu =$	0.25	Preparation Technique			As galvanised	$\mu =$	0.14	Weathered galvanised	$\mu =$	0.20	Galvanised-wire brush	$\mu =$	0.31	Galvanised-grit blasted	$\mu =$	0.31	Bare steel, as-rolled	$\mu =$	0.35	
For weathered surfaces clear of rust and mill scale	$\mu =$	0.45
